

ABSTRACT OF THE DISCLOSURE

A portable wireless communication apparatus capable of attaining a broadband antenna characteristic with a simple structure is that incorporated in a mobile phone having first and second casings foldable through a hinge part and comprises first and second ground conductors respectively incorporated in the first and second casings, and a flexible printed circuit board for connecting the first and second ground conductors. The flexible printed circuit board is of a structure that signal lines for electrically connecting circuits respectively on the first and second ground conductors that are spaced at a prescribed interval are integral, through an insulator, with a conductor line for supplying a high frequency signal to either first or second ground conductor to electrically connect the first and second ground conductors through the conductor line. Then, feeding is effected with an end of a feeder connected to the conductor line.
